## SPDT RF SWITCH

## Absorptive RF Switch with internal driver. <br> Single Supply Voltage , +3V

## Product Features

- Very Low Insertion loss over entire frequency range
- Super High Isolation over entire frequency range
- High Input IP3, +55 dBm typ.
- Single positive supply voltage, +3V
- Very low DC current consumption, $8 \mu \mathrm{~A}$
- Immune to latch up
- Unique design-simultaneous switch off of RF1\&RF2

## HSWA2-30DR+

CASE STYLE: DG983-1

## Typical Applications

- Base Station Infrastructure
- Portable Wireless
- CATV \& DBS
- MMDS \& Wireless LAN
- Band switch
- Diplexer switches
- Bypass switches

## General Description

The HSWA2-30DR+ is a $50 \Omega$ high isolation SPDT RF switch designed for wireless applications, covering a broad frequency range from DC up to 3GHz with low insertion loss. The HSWA2-30DR+ operates on a single supply voltage +3 V . See application note $\mathrm{AN}-80-006$ for +5 V supply voltage. This unit includes an internal CMOS control driver with two-pins control. The switch consumes very low supply current, $8 \mu \mathrm{~A}$ typ. The HSWA2-30DR+ switch is in a very small size and low profile package, $4 \times 4 \mathrm{~mm}$ and 0.9 mm respectively.

| 4 | High | High | N/A | N/A |

## General notes:

1. When either of the RF1 or RF2 ports is closed (ON state), the closed port is connected to the RF Common port.
2. When either of the RF1 or RF2 ports is open (OFF state), the open port is connected to an internal $50 \Omega$ termination.
3. When both RF1 and RF2 ports are open (OFF state), the all three RF ports are connected to an internal $50 \Omega$ termination.

Suggested Layout for PCB Design (PL-206)

## Recommended layout for PCB design

The amount of vias surrounding the device in the suggested PCB layout are critical for obtaining the specified isolation performance for the device shown in the datasheet.

[^1]
## TB-347 Evaluation Board Schematic Diagram

## How to use evaluation Board TB-347

The Evaluation board TB-347 was designed to evaluate the electrical performance of the HSWA2-30DR+ SPDT switch.

RF3 and RF4 SMA $50 \Omega$ connectors are connected through a $50 \Omega$ transmission line that is used to estimate the evaluation board loss for de-embedding purposes. The transmission lines were designed using a coplanar waveguide with ground plane. For details, please see suggested PCB layout on Page 8. The number of vias surrounding the switch is critical for obtaining the specified isolation.

The TB-347 operates from +2.7 V to +6.5 V applied to VDD connector. IC1 voltage regulator limits the supply voltage to the switch to +3.3 V . IC2 is a Schmitt trigger \& buffer which prevents an overload of switch control inputs from high level control signals (up to +5.5 V ) and prevents from noise and transient spikes during switching process.

The control connector is used for computer control mode or manual operation mode. In manual control mode connect Control 1 and/or Control 2 to ground to set Control 1 and/or Control 2 to logic low, respectively. When jumpers are removed, the digital control input pulled up to VDD for logic high.
For computer control mode the software \& cable are supplied. The cable should be connected between computer LPT port and evaluation board control connector.
