SPI RF SP10T Switch

SPI-SP10T-63

50Ω 1 to 6000 MHz

The Big Deal

- Daisy Chain SPI Control
- High Isolation (80 dB typ)
- High speed switching (6 µs typ)
- High power handling (+27 dBm max)
- SMP snap-on RF connectors

Product Overview

Mini-Circuits' SPI-SP10T-63 is a low cost, high speed solid state RF SP10T absorptive switch, with control and power via a Digital Snap Fit connector. The model contains an electronic, high speed (6 µs typ switching time), high linearity (IP3 50 dBm typ), SP10T switch. The RF switch is operated using a 3-wire SPI interface compatible with TTL and LVTTL voltages and allows connecting up to 50 units in series to the same control line in a 'Daisy Chain' configuration. The RF switch operates over a wide frequency band from 1 to 6000 MHz with high isolation (80 dB typical) making the switch perfectly suitable for a wide variety of RF applications.

The SPI-SP10T-63 is constructed in a compact, rugged metal case (4.58" x 3.395" x 0.40") with 11 SMP(M) connectors (COM, and J1 to J10), and two Digital Snap-fit connectors providing a strong mechanical connection for SPI control and power, one for input and one for output when connecting multiple units in series.

Key Features

Feature	Advantages
Daisy chain SPI control	Allows connecting up to 50 units in series to a single power supply and 3 wire SPI control.
RF SP10T absorptive switch	Wideband (1 to 6000 MHz) with high isolation (80 dB typ.), and high power rating (+27 dBm through path).
High Linearity (IP3 +50 dBm typ.)	Results in little or negligible inter-modulation generation, meeting requirements for digital communications signals
Solid state switch	Provides high speed (6 µs typ) switching with no wear on the switch as with electro-mechanical designs
DC Blocking	No need for external DC blocking circuitry
SMP connectors	Snap on RF connectors allow quick assembly and disassembly and the small size of SMP connectors makes tighter assemblies possible

50Ω 1 to 6000 MHz

Features

- High speed switching (6 µs typ)
- 1 to 6000 MHz SP10T absorptive RF switch
- High power handling, +27 dBm
- High linearity (IP3 +50 dBm)
- High isolation (80 dB typ)
- SPI control
- Daisy-chain up to 50 switches to control through a single interface (see pages 4-5)
- Easy installation and operation

Control Interface

The SPI-SP10T-63 serial interface consists of 4 control bits per unit that select the desired switch state, as shown in Table 1: Switch Logic Table.

Table 1: Switch Logic Table

A0	A1	A2	A3	Switch State

The serial interface is a 4-bit serial in, parallel-out shift register buffered by a transparent latch. It is controlled by three-wire SPI protocol using Data, Clock, and Latch Enable (LE) and an additional Lock for added noise immunity and increased flexibility in controlling the units. All signal voltages are compatible with TTL and LVTTL. The Data and Clock inputs allow data to be serially entered into the shift register, a process that is independent of the state of the LE input.

The LE input controls the latch. When LE is HIGH, the latch is transparent and the contents of the serial shift register control the switch. When LE is brought LOW, data in the shift register is latched.

Lock is used to lock the current state of the switch regardless of LE state or shift register, while allowing the LE to pass to other switches in the chain. If Lock is at logic HIGH the switch will respond to LE normally, when Lock is at logic LOW the switch will not respond to LE. If Lock is not required it can be kept constantly at logic high.

The shift register should be loaded while LE is held LOW to prevent the switch state from changing as data is entered. If multiple units are connected in series, data for all units should be entered before raising the LE to prevent switches assuming unanticipated states. Thus for example if three units are connected in daisy chain all 12 bits of control should be entered before raising the LE (see figures 2-4 for connecting units in daisy chain).

The LE input should then be toggled HIGH and brought LOW again, latching the new data. The timing for this operation is defined by Figure 1: Serial Interface Timing Diagram and Table 2: Serial Interface AC Characteristics.

Note:

1. LE is connected in parallel to all units in a daisy chain using the switches internal buffers to prevent control current from increasing as more units are connected.

Environmental Specifications **ENV55**

All Mini-Circuits products are manufactured under exacting quality assurance and control standards, and are capable of meeting published specifications after being subjected to any or all of the following physical and environmental test.

Specification	Test/Inspection Condition	Reference/Spec
Operating Temperature	-0° to 50° C Ambient Environment	Individual Model Data Sheet
Storage Temperature	-20° to 60° C Ambient Environment	Individual Model Data Sheet
Operating and Storage Humidity	5% to 85% RH (non-condensing)	Ambient
Bench Handling Test	Bench Top Tip 45° & Drop	MIL-PRF-28800F
Transit Drop Test	Free Fall Drop, 20 cm (7.9 inches)	MIL-PRF-28800F Class 3
