PRODUCT OVERVIEW

Mini-Circuits' ZVA-71863LNX+ is a coaxial, low noise high frequency amplifier, operating from 71 to 86 GHz. This model operates over a single positive supply range of +10 to +15V, allowing users to choose their desired operating voltage. Internal DC-DC conversion circuitry maintains constant efficiency over the full input voltage range. The amplifier incorporates several DC-protection features, such as over-voltage, reverse voltage and in-rush current, that protect the amplifier from damage if mishandled during operation. The high frequency operation combined with high gain and low noise figure makes this amplifier an ideal choice for automotive, radar/sensing applications, and 5G testing in E-band frequency ranges.

KEY FEATURES

Feature	Advantages
High Freq amplifier, 71 to 86 GHz	E-band LNA covering 5G, Automotive Radar (77 to 81 GHz) and SATCOM E-band (71 to 76 GHz, 81 to 86 GHz)
High gain Low VSWR Medium output power	The combination of low noise figure (4.5dB typ.) and high gain (37dB typ.) provides significant amplification with very little signal integrity degradation
Adjustable DC supply voltage	The device is capable of operating on a single supply voltage from +10 to +15 V with consistent DC power consumption, providing ease and flexibility for incorporation into test setups and systems
DC Protection – Over-voltage Reverse voltage In-rush current	The internal DC circuitry allows the amplifier to be protected from external mishandling that could lead to catastrophic failures in the field
